Installing the Palo Alto VPN Global Protect Mobile App (Android)

- Use your mobile device’s app marketplace (i.e. Google Play, Apple App Store, etc) to find and install the **GlobalProtect** (by Palo Alto Networks) app.

- Once downloaded and installed, open the **GlobalProtect** app. You will be presented with the following screen. Enter `vpn.carthage.edu` in the **Server** field and your Novell username and password and click **Connect**.
• Upon connecting, you may be presented with an alert message. You can select the **I trust this application** checkbox and click **OK**.

• If you have a successful connection, you will see the screen below. If you do not, please try re-entering your username and password at the login screen and connecting again.

• At this point you can minimize the app and use your device normally. You will stay connected to VPN until you manually disconnect. The main indicator you are connected to VPN is the key in the upper left corner.
